

Scandyna Minipod Mk II - The audio classic gains a technical face lift, with improved drive units and crossover.

Aldermaston, UK - 8th November 2011 - Scandyna, the Danish loudspeaker company, is pleased to announce the Minipod Mk II. First introduced over 20 years ago, the MiniPod is one of the world's most recognised loudspeakers and has become a design icon. Having sold over 100,000 units worldwide, the Minipod has also been a great commercial success.

Scandyna Minipod Mk II

The Minipod Mk II follows an organic design where **'form follows function'**, with each characteristic of the design having a precise acoustical justification. The Minipod Mk II's cabinet is essentially an **amalgamation of three spheres to form one pressure-vessel**, minimizing cabinet vibration, sound radiation and distortion, allowing sound waves to move more freely.

The Minipod Mk II differs in many ways from the original design. The **mid/bass driver has been re-designed** and now features a new 4-layer aluminium voice coil to improve efficiency. The **crossover has been upgraded** to incorporate the new driver and, to make use of the improved bass response, the crossover point had been changed down to 2700Hz from 3000Hz. These new enhancements mean that the Minipod Mk II carries on with the same **wow factor for its ergonomic design and sound quality that it was always famous for**.

The Minipod Mk II is available now in three standard colours - Black, Red or White - with a UK SRP of £549.00 a pair. Additional colours are available on request.

Notes to Editors

The Minipod originated in the UK during the 1990's, and was originally manufactured by Bowers & Wilkins Loudspeakers. Scandyna, a Danish Loudspeaker manufacturer owned by Peter M Hasselriis, has manufactured the Minipod since 1999. Scandyna has continuously developed new products; all following the same 'form follows function' design philosophy of the Minipod. The brands striking curved designs are engineered to reduce the unwanted reflective internal sound waves that can ruin a loudspeaker's performance.

All Scandyna products are developed and engineered in high-tech factories in Denmark and designated OEM manufactures in China.
